Outline

- Tree amplitudes from the Scattering Equations in any dimension
- Möbius invariance and massive Scattering Equations
- Proof of the equivalence with $\phi^3$ and Yang-Mills field theories
- In 4d: link variables, twistor string $\leftrightarrow$ the Scattering Equations
- Direct proof of equivalence between twistor string and field theory gluon tree amplitudes
- Polynomial form of the Scattering Equations
Tree Amplitudes

\[ \mathcal{A}(k_1, k_2, \ldots, k_N) = \oint_{\mathcal{O}} \psi_N(z, k, \epsilon) \prod'_{a \in A} \frac{1}{f_a(z, k)} \prod_{a \in A} \frac{d z_a}{(z_a - z_{a+1})^2} / d\omega, \]

\(\mathcal{O}\) encircles the zeros of \(f_a(z, k)\),

\[ f_a(z, k) \equiv \sum_{\substack{b \in A \\text{and}\ b \neq a}} \frac{k_a \cdot k_b}{z_a - z_b} = 0 \quad \text{The Scattering Equations} \]

(Cachazo, He, Yuan 2013) \ldots (Fairlie, Roberts 1972)

\[ k_a^2 = 0, \quad \sum_{a \in A} k_a^\mu = 0, \quad A = \{1, 2, \ldots N.\} \]

DG proved \(\mathcal{A}(k_1, k_2, \ldots k_n)\) are \(\phi^3\) and Yang-Mills gluon field theory tree amplitudes, as conjectured by CHY.
Möbius Invariance

\[ A(k_1, k_2, \ldots, k_N) = \oint_{\mathcal{O}} \psi_N(z, k, \epsilon) \prod_{a \in A} \frac{1}{f_a(z, k)} \prod_{a \in A} \frac{dz_a}{(z_a - z_{a+1})^2} / d\omega \]

The integrand and the Scattering Equations are Möbius invariant (CHY).
Massive Scattering Equations

\[ \hat{f}_a(z, k) = 0, \quad k_a^2 = m^2 \]

\[ U(z, k) \equiv \prod_{a < b} (z_a - z_b)^{-k_a \cdot k_b} \prod_{a \in A} (z_a - z_{a+1})^{-\frac{m^2}{2}} \]

is Möbius invariant,

\[ \frac{\partial U}{\partial z_a} = -\hat{f}_a U, \quad \hat{f}_a(z, k) = \sum_{b \in A \atop b \neq a} \frac{k_a \cdot k_b}{z_a - z_b} + \frac{m^2}{2(z_a - z_{a+1})} + \frac{m^2}{2(z_a - z_{a-1})}, \]

implying \( \hat{f}_a(z) \to \hat{f}_a(z) \frac{(\gamma z_a + \delta)^2}{(\alpha \delta - \beta \gamma)} \).

The infinitesimal transformations \( \delta z_a = \epsilon_1 + \epsilon_2 z_a + \epsilon_3 z_a^2 \),

\[ U(z + \delta z) \sim U(z) + \frac{\partial U}{\partial z_a} \delta z_a, \]

so the \( \hat{f}_a \) satisfy the three relations

\[ \sum_{a \in A} \hat{f}_a = 0, \quad \sum_{a \in A} z_a \hat{f}_a = 0, \quad \sum_{a \in A} z_a^2 \hat{f}_a = 0. \]

There are \( N - 3 \) independent Scattering Equations \( \hat{f}_a = 0 \).

Fixing \( z_1 = \infty, z_2 = 1, z_N = 0 \), there are \( N - 3 \) variables,

and generally \((N - 3)!\) solutions \( z_a(k) \). \( \hat{f} = f \) when \( m^2 = 0 \).
Total Amplitudes

For example, $N = 4$,

$$A^{abcd}(k_1, k_2, k_3, k_4) = g^2 \left( f_{abe} f_{ecd} \frac{n_s}{s} + f_{bce} f_{ead} \frac{n_t}{t} + f_{cae} f_{ebd} \frac{n_u}{u} \right)$$

$$= g^2 \left( (\text{tr}(T_a T_b T_c T_d) + \text{tr}(T_d T_c T_b T_a)) A(1234) ight.$$  

$$+ (\text{tr}(T_a T_c T_d T_b) + \text{tr}(T_b T_d T_c T_a)) A(1342)$$  

$$+ (\text{tr}(T_a T_d T_b T_c) + \text{tr}(T_c T_b T_d T_a)) A(1423) \right) ,$$

$$n_s = (\epsilon_1 \cdot \epsilon_2 (k_1 - k_2)^{\alpha} + 2 \epsilon_1 \cdot k_2 \epsilon_2^{\alpha} - 2 \epsilon_2 \cdot k_1 \epsilon_1^{\alpha})$$

$$\times \left( \epsilon_3 \cdot \epsilon_4 (k_3 - k_4)^{\alpha} + 2 \epsilon_3 \cdot k_4 \epsilon_4^{\alpha} - 2 \epsilon_4 \cdot k_3 \epsilon_3^{\alpha} \right)$$

$$+ (\epsilon_1 \cdot \epsilon_3 \epsilon_2 \cdot \epsilon_4 - \epsilon_1 \cdot \epsilon_4 \epsilon_2 \cdot \epsilon_3) s ,$$

$$A(1234) = \frac{n_s}{s} + \frac{n_t}{t} . \quad s = (k_1 + k_2)^2, \quad t = (k_2 + k_3)^2, \quad u = (k_1 + k_3)^2 ,$$

$$A(k_1, k_2, k_3, k_4) = A(1234) .$$
A Single Scalar Field, Massless $\phi^3$

A single massless scalar field, $\Psi_N = 1$.

$$\mathcal{A}^\phi(k_1, k_2, \ldots, k_N) = \int \prod_{a \in A} \frac{1}{f_a(z, k)} \prod_{a \in A} \frac{dz_a}{(z_a - z_{a+1})^2} / d\omega$$

$$\mathcal{A}^\phi(k_1, k_2, k_3, k_4) = \frac{1}{s} + \frac{1}{t},$$

$$A^{\text{total}} = \mathcal{A}^\phi(k_1, k_2, k_3, k_4) + \mathcal{A}^\phi(k_1, k_3, k_2, k_4) + \mathcal{A}^\phi(k_1, k_4, k_2, k_3)$$

$$= 2 \left( \frac{1}{s} + \frac{1}{t} + \frac{1}{u} \right)$$
Proof of the Formula of CHY for Massless $\phi^3$

\[ A_N^\phi(\zeta) = A_N^\phi(k_1, k_2 + \zeta \ell, k_3, \ldots, k_{N-1}, k_N - \zeta \ell), \]

For $\ell^2 = \ell \cdot k_2 = \ell \cdot k_N = 0$, these shifted, ordered field theory tree amplitudes have simple poles in $\zeta$, and $A_N^\phi(\zeta) \to 0$ as $\zeta \to \infty$.

\[ A_N^\phi(\zeta) = - \sum_i \frac{\text{Res}_{\zeta_i} A_N^\phi}{\zeta_i - \zeta} \]

The poles $\zeta_i$ occur where $(\pi_m^\zeta)^2 = 0$ or $(\bar{\pi}_m^\zeta)^2 = 0$, i.e. at

\[ \zeta = s_m/2\pi_m \cdot \ell \equiv \zeta_m^L, \quad \text{and} \quad \zeta = -\bar{s}_m/2\bar{\pi}_m \cdot \ell \equiv \zeta_m^R, \quad 3 \leq m \leq N - 1, \]

with residues given by

\[ \text{Res}_{\zeta_m^R} A_N^\phi = A_m^\phi(k_1, k_2^{\zeta_m^R}, k_3, \ldots, k_{m-1}, -\bar{\pi}_m^{\zeta_m^R}) \frac{1}{2\bar{\pi}_m \cdot \ell} \]

\[ \times A^\phi_{N-m+2}(\bar{\pi}_m^{\zeta_m^R}, k_m, \ldots, k_{N-1}, \bar{\pi}_m^{\zeta_m^R}), \]

$\pi_m \equiv -k_2 - k_3 - \ldots - k_m$, $\bar{\pi}_m \equiv -k_m - k_3 - \ldots - k_N$; $s_m = \pi_m^2$, $\bar{s}_m = \bar{\pi}_m^2$. 
\[ A^\phi(k_1, k_2, \ldots, k_N) = A_N^\phi(\zeta = 0) \]

\[ = -2 \sum_{m=3}^{N-1} \left[ \frac{2\pi m \cdot \ell}{s_m} \text{Res}_{\zeta_m} A_N^\phi - \frac{2\pi m \cdot \ell}{\bar{s}_m} \text{Res}_{\zeta_m} A_N^\phi \right] \]

which determines \( A^\phi(k_1, \ldots, k_N) \) for \( N > 3 \) from \( A^\phi(k_1, k_2, k_3) = 1 \).

Our proof is to show \( A^\phi = A^\phi \) satisfies \( \ast \).

\[ A_N^\phi(\zeta) \sim \int \prod_{a=3}^{N-2} \frac{Z_a \prod_{a=4}^{N-1} (1 - Z_a)}{(1 - Z_3)Z_{N-1}} \prod_{b=5}^{N-1} \prod_{a=3}^{b-2} (Z_a - Z_b)^2 \prod_{a=3}^{N-1} \frac{dz_a}{f_a(Z, \zeta)} \]

A pole at \( \zeta_m^R \) comes from the integration region \( z_a \to 0 \), \( m \leq a \leq N - 1 \). Let \( z_a = x_a z_m \), \( z_m \to 0 \),
\[ \prod_{a=3}^{N-1} dz_a = \prod_{a=3}^{m-1} dz_a \, dz_m \prod_{a=m+1}^{N-1} dx_a, \]

\[
\text{Res}_{\zeta_m^R} A_N^\phi = A_m^\phi(k_1, k_2^{\zeta_m^R}, k_3, \ldots, k_{m-1}, -\bar{\pi}_m^{\zeta_m^R}) \frac{1}{2\pi_m \cdot \ell} \\
\times A_{N-m+2}^\phi(\bar{\pi}_m^{\zeta_m^R}, k_m, \ldots, k_{N-1}, k_N^{\zeta_m^R}),
\]

Similarly for \( \text{Res}_{\zeta_m^L} A_N^\phi \).

So proving the formula for \( A_N^\phi(k_1, \ldots, k_N) \) by induction.
Proof for Pure Gauge Theory

\[ A_N^\text{YM}(\zeta) \sim \int \psi_N^o \frac{\prod_{a=3}^{N-2} z_a \prod_{a=4}^{N-1} (1 - z_a)}{(1 - z_3) z_{N-1}} \prod_{b=5}^{N-1} \prod_{a=3}^{b-2} (z_a - z_b)^2 \prod_{a=3}^{N-1} \frac{dz_a}{f_a(z, \zeta)} \]

where the only difference from the scalar case is \( \psi_N^o \), which is related to the Pfaffian of the antisymmetric matrix \( M_N \) with the 2nd and Nth rows and columns removed,

\[ \psi_N^o = (-1)^N \text{Pf} \ M_N(z; k^\zeta; \epsilon^\zeta)_{(2,N)} \prod_{a=1}^{N} (z_a - z_{a+1}), \]

\[ \det M \equiv (\text{Pf} \ M)^2, \]

\[ \epsilon^\zeta_2^+ = \bar{\ell} - 2(\zeta/k_2 \cdot k_N)k_N, \quad \epsilon^\zeta_2^- = \ell; \quad \epsilon^\zeta_4^{\pm}, \]

\[ \bar{\ell}^2 = \bar{\ell} \cdot k_2 = \bar{\ell} \cdot k_N = 0, \ell \cdot \bar{\ell} = 2. \]
All singularities in $\Psi^o_N$ are canceled by the numerator. $\Psi^o_N$ factorizes at the poles in the integrand $\zeta^{L,R}_m$, since the Pfaffian does. As $z_m \to 0$,

$$\text{Pf } M_N(k_1, \ldots, k_N; \epsilon_1, \ldots, \epsilon_N; z_3, \ldots, z_{N-1})_{(2,N)}$$

$$\sim \sum_s \text{Pf, } M_m(k_1, \ldots, k_{m-1}, -\bar{\pi}_m; \epsilon_1, \ldots, \epsilon_{m-1}, \epsilon^s; z_3, \ldots, z_{m-1})_{(2,m)}$$

$$\times \text{Pf } M_{N-m+2}(\bar{\pi}_m, k_m, \ldots, k_N; \epsilon^s, \epsilon_m, \ldots, \epsilon_N; x_{m+1}, \ldots, x_{N-1})_{(1,N-m+2)},$$

and

$$\prod_{a=2}^{N-1} (z_a - z_{a+1}) \to z_{m-1} z_m^{N-m} \prod_{a=2}^{m-2} (z_a - z_{a+1}) \prod_{a=m}^{N-1} (x_a - x_{a+1})$$

This demonstrates that $A^\text{YM}_N(\zeta = 0)$ satisfies the BCFW recurrence relation, so that $A^\text{YM}(k_1, \ldots, k_N)$, computed from the scattering equations, are equal to the Yang Mills field theory tree amplitudes.
Twistor String Theory (4d)

\[ k^\mu \sigma_{\mu \alpha \dot{\alpha}} \equiv k_{\alpha \dot{\alpha}} = \pi_\alpha \bar{\pi}_{\dot{\alpha}}, \quad \text{Conjugate twistor variables} \]

\[
Z = \begin{pmatrix} \pi_\alpha \\ \omega_{\dot{\alpha}} \end{pmatrix}, \quad W = \begin{pmatrix} \bar{\omega}_\alpha \\ \bar{\pi}_{\dot{\alpha}} \end{pmatrix}, \quad W \cdot Z = \bar{\omega}_\alpha \pi^\alpha + \bar{\pi}_{\dot{\alpha}} \omega^{\dot{\alpha}},
\]

and twistor string worldsheet fields, \( Z(\rho) = \begin{pmatrix} \chi^\alpha(\rho) \\ \mu^{\dot{\alpha}}(\rho) \end{pmatrix} \).

Fourier transform gluon vertex operators according to helicity:

\[
V_+^A(W, \rho) = \int \frac{d\kappa}{\kappa} e^{i \kappa W Z(\rho)} J^A,
\]

\[
V_-^A(Z, \rho) = \int \kappa^3 d\kappa \delta^4(\kappa Z(\rho) - Z) J^A \psi^1 \ldots \psi^4.
\]

Tree \( M^{\epsilon_1 \ldots \epsilon_N} = \int \langle 0 | e^{(n-1)q_0} \prod_{s \in \mathcal{N}} \delta^4(\kappa_s Z(\rho_s) - Z_s) \times \exp \left\{ i \sum_{j \in \mathcal{P}} \kappa_j W_j \cdot Z(\rho_j) \right\} | 0 \rangle \prod_{a=1}^{N} \frac{d\rho_a d\kappa_a}{\kappa_a} \prod_{s \in \mathcal{N}} \kappa_s^4 \times \prod_{r<s; r, s \in \mathcal{N}} (\rho_r - \rho_s)^4 \langle 0 | J^{A_1}(\rho_1) J^{A_2}(\rho_2) \ldots J^{A_N}(\rho_N) | 0 \rangle / dg
\]
\[ \delta^4(\kappa_s Z(\rho_s) - Z_s) \]

\[ Z(\rho) = \mathcal{Z}_0 + \mathcal{Z}_{-1}\rho + \cdots + \mathcal{Z}_{-n+1}\rho^{n-1}, \text{ polynomial of order } n - 1, \]

so

\[ Z(\rho) = \sum_{s \in \mathcal{N}} \frac{1}{\kappa_s} Z_s \prod_{r \neq s; r \in \mathcal{N}} \frac{\rho - \rho_r}{\rho_s - \rho_r}, \quad \text{where } \kappa_s Z(\rho_s) = Z_s. \]

The positive helicity vertices become

\[ e^{i \sum_{j \in \mathcal{P}} \kappa_j W_j \cdot Z(\rho_j)} = e^{i \sum_{j \in \mathcal{P}} \sum_{s \in \mathcal{N}} c_{js} W_j \cdot Z_s} \]

where \( c_{js} = \frac{\kappa_j}{\kappa_s} \prod_{r \neq s; r \in \mathcal{N}} \frac{\rho_j - \rho_r}{\rho_s - \rho_r} = \frac{\lambda_j}{\lambda_s (\rho_j - \rho_s)} \) are the link variables.

Fourier transforming to momentum space,

\[ \mathcal{M}^{\epsilon_1 \cdots \epsilon_N} = \langle r_1, r_n \rangle^2 (\rho_{r_1} - \rho_{r_n})^2 \int \prod_{j \in \mathcal{P}} \delta^2 \left( \pi_j - \sum_{r \in \mathcal{N}} c_{jr} \pi_r \right) \]

\[ \times \prod_{s \in \mathcal{N}'} \delta^2 \left( \bar{\pi}_s + \sum_{i \in \mathcal{P}} \bar{\pi}_i c_{is} \right) \]

\[ \times \prod_{a=1}^N \frac{1}{(\rho_a - \rho_{a+1})} \prod_{a=1}^N \frac{d\kappa_a d\rho_a}{\kappa_a}. \]
4-dimensional momenta $k_{a\alpha\dot{\alpha}} = \pi_{a\alpha} \bar{\pi}_{a\dot{\alpha}}$, $1 \leq a \leq N$; $\alpha, \dot{\alpha} = 1, 2$. 
\{ $a \in A : a = i \in \mathcal{P}$, $r \in \mathcal{N}$, $m + n = N$\}, $\rho_a \equiv z_a$.

Link variables $c_{ir} \equiv \frac{\lambda_i}{\lambda_r(z_i - z_r)}$ satisfy:

$$\pi_{i}^{\alpha} = \sum_{r \in \mathcal{N}} c_{ir} \pi_{r}^{\alpha}, \quad -\bar{\pi}_{r\dot{\alpha}} = \sum_{i \in \mathcal{P}} \bar{\pi}_{i\dot{\alpha}} c_{ir}.$$ 

**BCFW in Twistor String Theory link variables**

$$M_{mn}(\zeta) = K_{mn} \oint_{\mathcal{O}} F_{mn}(c(\zeta)) \prod_{a=2}^{m-1} \prod_{b=2}^{n-1} \frac{dc_{ia} r_b}{C_{ab}(c(\zeta))},$$

$$M_{mn}(\zeta) = \sum_{z_i} \frac{M_{mn}^{\zeta_i}}{\zeta - \zeta_i}, \quad M_{mn} = M_{mn}(0) = -\sum_{z_i} \frac{1}{\zeta_i} M_{mn}^{\zeta_i}.$$ 

Analysis of the poles and residues proves BCFW, demonstrating equivalence between the twistor string amplitudes and Yang Mills.
Twistor String Equations imply the Scattering Equations

\[ 2 \sum_b \frac{k_i \cdot k_b}{z_i - z_b} = \sum_r \frac{\langle \pi_i, \pi_r \rangle [\bar{\pi}_i, \bar{\pi}_r]}{z_i - z_r} + \sum_j \frac{\langle \pi_i, \pi_j \rangle [\bar{\pi}_i, \bar{\pi}_j]}{z_i - z_j} \]

\[ \sum_r \frac{\langle \pi_i, \pi_r \rangle [\bar{\pi}_i, \bar{\pi}_r]}{z_i - z_r} = - \sum_{rsj} \frac{c_{is} \langle \pi_s, \pi_r \rangle [\bar{\pi}_i, \bar{\pi}_j] c_{jr}}{z_i - z_r} \]

\[ = \frac{1}{2} \sum_{rsj} \frac{\lambda_i \lambda_j \langle \pi_r, \pi_s \rangle [\bar{\pi}_i, \bar{\pi}_j](z_r - z_s)}{\lambda_r \lambda_s (z_i - z_r)(z_i - z_s)(z_j - z_r)(z_j - z_s)} \]

\[ \sum_j \frac{\langle \pi_i, \pi_j \rangle [\bar{\pi}_i, \bar{\pi}_j]}{z_i - z_j} = \sum_{rsj} \frac{c_{ir} c_{js} \langle \pi_r, \pi_s \rangle [\bar{\pi}_i, \bar{\pi}_j]}{z_i - z_j} \]

\[ = - \frac{1}{2} \sum_{rsj} \frac{\lambda_i \lambda_j \langle \pi_r, \pi_s \rangle [\bar{\pi}_i, \bar{\pi}_j](z_r - z_s)}{\lambda_r \lambda_s (z_i - z_r)(z_j - z_s)(z_i - z_s)(z_j - z_r)}. \]

So \( \sum_b \frac{k_i \cdot k_b}{z_i - z_b} = 0 \), and similarly \( \sum_b \frac{k_r \cdot k_b}{z_r - z_b} = 0 \).

\[ 2k_a \cdot k_b = \langle \pi_a, \pi_b \rangle [\bar{\pi}_a, \bar{\pi}_b] \]; \[ \langle \pi_a, \pi_b \rangle \equiv \pi_{a\alpha} \pi^\alpha_b \], \[ [\pi_a, \pi_b] \equiv \bar{\pi}_{a\dot{\alpha}} \pi^\dot{\alpha}_b \]
Polynomial Form for the Scattering Equations

For a subset $U \subset A$,

$$k_U \equiv \sum_{a \in U} k_a, \quad z_U \equiv \prod_{b \in U} z_b,$$

then the Scattering Equations

$$\sum_{b \in A \atop b \neq a} \frac{k_a \cdot k_b}{z_a - z_b} = 0$$

are equivalent to the homogeneous polynomial equations

$$\sum_{U \subset A \atop |U| = m} k_U^2 z_U = 0, \quad 2 \leq m \leq N - 2,$$

where the sum is over all $\frac{N!}{m!(N-m)!}$ subsets $U \subset A$ with $m$ elements.
Proof of the Polynomial Form of the Scattering Equations

\[ p^\mu(z) \equiv \sum_{a \in A} \frac{k_a^\mu}{z - z_a}, \quad \sum_a k_a^\mu = 0, \quad k_a^2 = 0, \]

\[ p^2(z) = \sum_{a,b} \frac{k_a \cdot k_b}{(z - z_a)(z - z_b)} = \frac{1}{2} \sum_a \frac{1}{z - z_a} \sum_{b \neq a} \frac{k_a \cdot k_b}{(z_a - z_b)} = 0 \]

\[ 2p^2(z) \prod_{c \in A} (z - z_c) = \sum_{a,b \in A} 2k_a \cdot k_b \prod_{c \notin A} (z - z_c) \]

\[ = \sum_{m=0}^{N-2} z^{N-m-2} \sum_{U \subset A \atop |U|=m} z_U \sum_{S \subset \overline{U} \atop |S|=2} k_S^2 = 0 \]

where \( \overline{U} = \{ b \in A : b \notin U \} \). Using \( \sum_{S \subset \overline{U}} k_S^2 = k_{\overline{U}}^2 = k_U^2 \), then

\[ \tilde{h}_m \equiv \sum_{U \subset A \atop |U|=m} k_U^2 z_U = 0. \]
\[ A_N = \oint \psi_N(z, k) \frac{z_2}{z_{N-1}} \prod_{m=1}^{N-3} \frac{1}{h_m(z, k)} \prod_{2 \leq a < b \leq N-1} (z_a - z_b) \prod_{a=2}^{N-2} \frac{z_a dz_{a+1}}{(z_a - z_{a+1})^2}. \]

\[ h_m = \lim_{z_1 \to \infty} \frac{\tilde{h}_{m+1}}{z_1} = \frac{1}{m!} \sum_{a_1, a_2, \ldots, a_m \neq 1, N \atop a_j \text{ uneq.}} k_{1 a_1 \ldots a_m}^2 z_{a_1} z_{a_2} \ldots z_{a_m}, \quad 1 \leq m \leq N - 3, \]

The \( N - 3 \) polynomial equations \( h_m = 0 \), of degree \( m \), linear in each \( z_a \) individually, are equivalent to the Scattering Equations.

By Bézout’s theorem, they determine \( (N-3)! \) solutions for the ratios of the \( z_2, \ldots, z_{N-1} \).
Solutions to the Scattering Equations

\(N = 4\)

\[ h_1 = k_{12}^2 z_2 + k_{13}^2 z_3 = 0, \quad z_3/z_2 = -k_{12}^2/k_{13}^2 = -k_1 \cdot k_2/k_1 \cdot k_3. \]

\(N = 5\)

\[ h_1 = k_{12}^2 z_2 + k_{13}^2 z_3 + k_{14}^2 z_4 = 0, \]
\[ h_2 = k_{123}^2 z_2 z_3 + k_{124}^2 z_2 z_4 + k_{134}^2 z_3 z_4 = 0, \]

eliminating \(z_4\) yields a quadratic equation for \(z_3/z_2\).
Comments

The polynomial form of the Scattering Equations facilitates computation of their solutions \( z_a(k) \), due to the linearity of the equations in the individual variables \( z_a \).

The Scattering Equations can be generalized to massive particles, enabling the description of tree amplitudes for massive \( \phi^3 \) theory.

In four dimensions, the Scattering Equations and the twistor string equations are closely related.

The proofs make it certain that both the twistor string and the Scattering Equations approach are equivalent to gauge field theory at tree level.

This critical reasoning may provide insight into possible extensions to loop level of these non-Lagrangian methods.
